

TokTickIT

E2E evidence and release integration

Student	GUNTEE DOUNGMANEE		
Student ID	67070501003		
Peer reviewer	POLWARIT	WATTHANAHEMMARAT	(MadMax168), ID 67070501067
Repository	ovenmakemeheat/toktickit		
Issue	#77 – Lab 3 E2E evidence and release integration		
Feature branch	feature/19-e2e-evidence-release		
Integrated target	lab3-staging, baseline 4cb1049		
Current final branch	main, 0c21ee2 (Lab 2 release; Lab 3 release pending)		
Stack	React, TypeScript, Vite, Bootstrap, Express, Prisma, PostgreSQL		

STAGING EVIDENCE – 2026-09-18. This report records the Issue #77 feature-branch evidence and the reviewed Lab 3 feature sequence. The feature PR and the later **lab3-staging** to **main** release PR require human review and merge; this document does not claim that the Lab 3 release is already on **main**.

8	Answer Part 8: Evidence, Review, and Release Integration	4
9	Answer Part 9: Zen Green, Responsive Evidence, and Limits	5

1 Answer Part 1: Git Use with Engineering Workflow

Lab 3 uses one feature branch per approved Issue and integrates reviewed Pull Requests into `lab3-staging`. The human reviewer merges feature PRs; the PR author does not merge their own work. The Issue #77 branch inherited the latest merged PR #82 rather than branching from an older feature branch.

Issue / PR	Branch and merge state
#72 / #78	feature/14-sprint-specification; merged into lab3-staging by MadMax168.
#73 / #79	feature/15-authentication-and-requester; merged into lab3-staging by MadMax168.
#74 / #80	feature/16-it-staff-ticket-workflow; merged into lab3-staging by MadMax168.
#75 / #81	feature/17-administrator-user-management; merged into lab3-staging by MadMax168.
#76 / #82	feature/18-zen-green-visual-inspection; merged into lab3-staging by MadMax168.
#77 / pending	feature/19-e2e-evidence-release; this integration PR targets lab3-staging; the separate release PR targets main.

The current repository state is therefore intentionally two-stage: the feature branch supplies the evidence package, then the human reviewer verifies and merges it into `lab3-staging`. Only after that integration check should a separate release PR be opened from `lab3-staging` to `main`.

2 Answer Part 2: Specification DD

The contract is maintained in `docs/lab-03/specification.md` and is derived from the committed UTF-8 handout `UTF-8_Lab_3_sheet.pdf`. The API, UI, and test contracts are linked from that specification.

Issue #77 does not add another role feature. It connects the already reviewed authentication/Requester, IT Staff, Administrator, and Zen Green increments to actual browser flows, evidence, review records, and release checks. The important boundaries are:

- Requester ownership comes from the authenticated session; the old Development Requester selector is absent.
- IT Staff may claim/reassign, change IT Priority, use the approved status matrix, post Public Comments, and add Internal Notes.
- Administrators may review existing Tickets and change only IT Priority from the review surface; they do not receive Queue or operational mutation controls.
- Browser fixtures prove visible workflows, while Supertest/PostgreSQL tests prove server authorization, migration, session, and account-safety rules.
- A reviewer comment, automation result, or generated artifact is not treated as human approval.

3 Answer Part 3: Test DD and Traceability

The executed matrix is recorded in `docs/lab-03/tests.md`. The final Issue #77 feature-branch snapshot is:

Boundary	Result
Client Vitest	15 files, 58 tests passed.
Server Vitest / Supertest / PostgreSQL	22 files, 143 tests passed.
TypeScript	Client and server type checks passed.
Playwright Lab 3	12 tests passed across authentication/Requester, Staff, Administrator, responsive, and release suites.
Build	Client and server builds passed.

The E2E files are listed below; together they cover valid and invalid credentials, inactive accounts, mandatory password changes, logout, Requester regression, Queue/detail operations, comments/notes, Administrator User Management, read-only Ticket Review, IT Priority, responsive controls, and direct role-route protection.

- `e2e/lab-03/authentication-and-requester.spec.ts`
- `e2e/lab-03/staff-ticket-flow.spec.ts`
- `e2e/lab-03/user-administration.spec.ts`
- `e2e/lab-03/responsive-and-accessibility.spec.ts`
- `e2e/lab-03/release-regression.spec.ts`

The API and component suites remain the evidence for backend authorization and persistence.

4 Answer Part 4: AI Use with Reflection

The complete record is in [docs/lab-03/ai-use.md](#). OpenAI Codex ('gpt-5.6-luna', maximum reasoning) assisted with repository inspection, E2E implementation, test execution, evidence writing, and report preparation. The student reviewed the PDF-derived contract, selected the feature scope, inspected diffs and screenshots, ran the gates, and retained responsibility for human review responses and release decisions.

The useful design decision was to keep this issue bounded to integration. The coding agent did not add a new database model or broaden role permissions; it added browser-level evidence around the already merged product slices and explicitly documented where mocked browser responses differ from real API proof.

5 Answer Part 5: Authentication and Requester Regression

The authentication E2E flow starts from a protected route and verifies that an unauthenticated browser is sent to the sign-in screen. It exercises a valid login, generic invalid-credential feedback, a minimal inactive-account error, mandatory first-login password change, role navigation, logout, and the absence of the old Development Requester selector and Change Requester action.

The Requester regression keeps Create Ticket, My Tickets, Ticket Detail, and responsive overflow checks under the authenticated identity. Existing Lab 2 Attachment and ownership API tests remain part of the integrated test suite; the Playwright browser fixture intentionally does not pretend to replace those server-side checks.

Figure 2: Requester My Tickets at desktop viewport.

6 Answer Part 6: IT Staff Ticket Workflow

The IT Staff browser flow opens the Queue, changes search/status controls, opens a Ticket Detail, verifies existing Attachment metadata and an Internal Note, claims the unassigned Ticket, reassigns it to an eligible Administrator, changes IT Priority, applies a permitted status transition, posts a Public Comment, and adds an Internal Note. The server tests separately verify owner eligibility, CSRF, transition confirmation, concurrent conflict handling, and private-note visibility.

The Queue's responsive card/table behavior is covered by the browser regression and by the committed captures under [artifacts/lab-03/screenshots/staff-queue/](#) and [artifacts/lab-03/screenshots/staff-ticket-detail/](#).

Figure 4: IT Staff Ticket Detail evidence (cropped top workflow view; full capture retained in the evidence directory).

7 Answer Part 7: Administrator Management and Ticket Review

The Administrator flow covers the required list columns, name/email search, one role filter, create, edit, activation, and initial-password reset. It also checks the self-deactivation explanation. It then opens the known Ticket Review entry, validates an invalid ID, reviews facts/comments/notes/Attachment metadata, confirms that Queue/status/comment/note controls are absent, and updates only IT Priority.

A second browser scenario signs in as IT Staff and directly navigates to an Administrator route. The route remains inside the authenticated role shell and does not render User Management. The real API tests remain the authority for '403' responses and Administrator account-safety races.

Figure 5: Administrator User Management evidence.

Figure 6: Administrator Ticket Review evidence (cropped top workflow view; full capture retained in the evidence directory).

8 Answer Part 8: Evidence, Review, and Release Integration

The required evidence inventory is linked in [integration-verification.md](#). It includes authentication, IT Staff Queue, Staff Ticket Detail, User Management, Requester, and desktop/tablet/mobile screenshot directories. The visual inspection checklist records the target viewports '1280x900', '820x900', and '390x844', no horizontal overflow, accessible names, focus, and the card/table representation.

[reviewer.md](#) records the student and peer reviewer identities, PRs #78-#82, human review comments, author responses, merge evidence, and the pending Issue #77 review. It keeps automated Codex and GitGuardian output

separate from human approval. The Lab 3 project-board status and issue closure remain human responsibilities.

The release sequence is:

1. review and merge this Issue #77 PR into `lab3-staging`;
2. rerun the integration checks on the merged staging branch;
3. open a separate `lab3-staging` to `main` release PR;
4. obtain human review and human merge of that release PR.

9 Answer Part 9: Zen Green, Responsive Evidence, and Limits

The visual contract remains in `docs/lab-03/ui-spec.md`. The committed screenshots and browser assertions show the required screens at desktop, tablet, and mobile sizes. Labels, live/status regions, named buttons, visible focus, required indicators, and non-color state cues are tested at the user-observable boundary.

Boundary note. The evidence in this feature branch is not final-main evidence because Lab 3 has not yet been released from `lab3-staging` to `main`. The report is complete as an Issue #77 integration package, but the final release check, project-board transition, and issue closure require the human reviewer/owner.

No out-of-scope feature is claimed: there is no email delivery, social login, MFA, self-registration, User deletion, bulk User operation, SLA engine, notification service, dashboard, or production deployment work in this issue.
